1 Code Style.....	2
2 Subversion Access.....	2

1. Code Style

The following sections show how to set up the code style for Hama in Eclipse. It is strongly preferred that patches use this style before they are supplied.

[Download hama-eclipse-formatter.xml](#).

After this, select Window > Preferences, and open up the configuration for Java > Code Style > Code Formatter. Click on the button labeled Import... and select the file you downloaded. Give the style a name, and click OK.

2. Subversion Access

This project's Apache Subversion repository can be checked out through SVN with the following instruction set:

```
svn co https://svn.apache.org/repos/asf/incubator/hama hama
```

(Warning: This is a generic Subversion checkout command which will pull all modules, tags and/or branches of the project. Please refer to project home page for specific SVN instructions, or use "Browse Repository" link; in most cases, you will want to add '/trunk' to the HTTPS URL above to check out only trunk (main development line)).

NOTE: UNIX file and directory names are case sensitive.
