Environments

Table of contents

1. Code Style

The following sections show how to set up the code style for Hama in Eclipse. It is strongly preferred that patches use this style before they are supplied.
Download hama-eclipse-formatter.xml.
After this, select Window > Preferences, and open up the configuration for Java > Code Style > Code Formatter. Click on the button labeled Import... and select the file you downloaded. Give the style a name, and click OK.

2. Subversion Access

This project's Apache Subversion repository can be checked out through SVN with the following instruction set:
svn co https://svn.apache.org/repos/asf/incubator/hama/trunk hama
(Warning: This is a generic Subversion checkout command which will pull all modules, tags and/or branches of the project. Please refer to project home page for specific SVN instructions, or use "Browse Repository" link; in most cases, you will want to add '/trunk' to the HTTPS URL above to check out only trunk (main development line)).
NOTE: UNIX file and directory names are case sensitive.
